

SQL Project: Online Book Store

A hands-on SQL exploration using three interconnected CSV datasets — analyzing books, customers, and orders through structured queries.

The Dataset: 3 CSV Files

Tables must share at least one common column with the same name and data type to enable relational queries.

Books.csv

Contains **Book_ID** — the primary key linking to Orders

Customers.csv

Contains **Customer_ID** — the primary key linking to Orders

Orders.csv

Contains both **Book_ID** and **Customer_ID** — the bridge table

How the Tables Connect

Book_ID links Books to Orders, and Customer_ID links Customers to Orders — enabling joins across all three tables for powerful relational analysis.

PART 1

Basic Queries

Foundational SQL operations — filtering, sorting, and aggregating data across the three tables.

Basic Queries: Filtering & Retrieval

Genre Filter

Retrieve all books in the "Fiction" genre

Year Filter

Find books published after 1950

Location Filter

List all customers from Canada

Date Filter

Show orders placed in November 2023

Genres List

List all genres available in the Books table

Basic Queries: Aggregation & Analysis

1 Total Stock

Retrieve the total stock of books available

2 Most Expensive Book

Find the details of the most expensive book

3 Lowest Stock

Find the book with the lowest stock

4 Quantity Filter

Show all customers who ordered more than 1 quantity of a book

5 Order Value

Retrieve all orders where the total amount exceeds \$20

6 Total Revenue

Calculate the total revenue generated from all orders

PART 2

Advanced Queries

Deeper analytical queries — grouping, aggregating, and ranking data to uncover insights across genres, authors, and customers.

Advanced Queries: Genre & Price Analysis

Books Sold by Genre

Retrieve the total number of books sold for each genre

Average Fantasy Price

Find the average price of books in the "Fantasy" genre

Top 3 Fantasy Books

Show the top 3 most expensive books of the Fantasy genre

Most Ordered Book

Find the most frequently ordered book

Advanced Queries: Customer & Stock Insights

1

Repeat Customers

List customers who have placed at least 2 orders

2

Top Spender

Find the customer who spent the most on orders

3

High-Spend Cities

List cities where customers who spent over \$30 are located

4

Sales by Author

Retrieve the total quantity of books sold by each author

5

Remaining Stock

Calculate the stock remaining after fulfilling all orders

Project at a Glance

3

CSV Tables

Books, Customers, Orders

11

Basic Queries

Filtering, sorting & aggregating

9

Advanced Queries

Grouping, ranking & analysis

20

Total Queries

Full SQL coverage

- 📄 This project demonstrates core SQL skills — SELECT, WHERE, GROUP BY, ORDER BY, JOINS, and aggregate functions — applied to a realistic e-commerce dataset.
